# ACHILLES TENDINOPATHY (mid-substance):
## Summary of the Evidence for Physical Therapy Interventions

**PURPOSE, SCOPE & DISCLAIMER:** The purpose of this document is to provide physical therapists with a summary of the evidence for interventions commonly used to manage mid-substance Achilles tendinopathy. This decision-making tool is evidence-informed and where there is insufficient evidence, expert-informed. It is not intended to replace the clinician’s clinical reasoning skills and inter-professional collaboration. ‘Acute’ refers primarily to the stage with the cardinal signs of heat, redness, pain, swelling and loss of function and a very recent onset of symptoms.

<tr>
<td><strong>Low level laser therapy (LLLT)</strong></td>
<td>Acute</td>
<td>Yes 2 SR</td>
<td>Yes</td>
<td>There is no clinical evidence, but there is a physiological rationale, to support the use of LLLT in the acute stage.</td>
<td>May consider a trial of LLLT in the acute stage at the doses recommended by the World Association for Laser Therapy (<a href="http://www.walt.nu">www.walt.nu</a>) i.e., 2-4 J/point (not per cm²)*, minimum 2-3 points. *See Appendix B for further details on calculation of dosage.</td>
</tr>
<tr>
<td><strong>Ultrasound (US)</strong></td>
<td>Chronic</td>
<td>Yes 1 MA 5 RCT</td>
<td>Yes</td>
<td>There is conflicting clinical evidence and conflicting expert opinion to support the use of LLLT in the chronic stage.</td>
<td>Consider a trial of LLLT in the chronic stage at the following parameters: 0.9 J/point (not per cm²)*; 6 points on tendon. *See Appendix B for further details on calculation of dosage.</td>
</tr>
<tr>
<td><strong>Extracorporeal shock wave therapy (SWT)</strong></td>
<td>Acute</td>
<td>No</td>
<td>No</td>
<td>There is no clinical evidence, but there is physiological rationale, to support the use of US in the acute stage.</td>
<td>May consider a trial of US in the acute stage at a low to moderate dose (0.5 - 1.0 W/cm², pulsed 1:4-1:1, 3 MHz, 5 mins for each treatment area equivalent in size to transducer head). *See Appendix B for further details on calculation of dosage.</td>
</tr>
<tr>
<td><strong>Extracorporeal shock wave therapy (SWT)</strong></td>
<td>Chronic</td>
<td>No</td>
<td>No</td>
<td>There is no clinical evidence and no physiological rationale to support the use of US in the chronic stage.</td>
<td>Consider NOT using US in the chronic stage.</td>
</tr>
<tr>
<td><strong>Extracorporeal shock wave therapy (SWT)</strong></td>
<td>Acute</td>
<td>No</td>
<td>Yes</td>
<td>There is expert opinion which suggests that SWT be reserved for chronic stage.</td>
<td>Consider NOT using Extracorporeal Shock Wave for the acute stage.</td>
</tr>
<tr>
<td><strong>Extracorporeal shock wave therapy (SWT)</strong></td>
<td>Chronic</td>
<td>Yes 4 RCT 1 Cohort</td>
<td>Yes</td>
<td>There is conflicting evidence to support the use of SWT in the chronic stage. There is evidence suggesting that the outcomes are dependent upon the dosage of the shock wave energy (EFD - energy flux density = mJ/mm²), rather than the type of shock wave generation (focused vs. radial SWT). There is also evidence that the use of anesthetic required in high energy protocols decreases the effectiveness of SWT. Therefore, using low energy SWT protocols without the need for anesthetic are recommended as more practical, more tolerable, and less expensive with equivalent results. Low energy SWT protocols can apply to both focused and radial SWT.</td>
<td>Consider a trial of SWT in the chronic stage, especially if other interventions have failed, at the following parameters: Low energy SWT: EFD = 0.18 – 0.3 mJ/mm² (2-4 Bars) 2000-3000 shocks 15-30 Hz 3-5 sessions, weekly intervals. Advise patients that this is an experimental technique. SWT enhances the outcomes compared to eccentric exercise alone, therefore patients should be instructed to continue with a well-designed exercise program.</td>

CS - Case studies; MA - Meta-analyses; OS - Observational studies; RCT - Randomized controlled trials; SR - Systematic reviews

For any intervention selected by the clinician, it is strongly recommended that the clinician use one or more of the following outcome measures:

**A. Patient reported outcome measure such as:**
- A global measure of lower extremity function: e.g., The Lower Extremity Functional Scale (LEFS) - not specific to Achilles tendinopathy
  - [http://www.physther.net/content/79/4/371/F1.large.jpg](http://www.physther.net/content/79/4/371/F1.large.jpg)
- Detailed questionnaire, specific to Achilles tendinopathy e.g. the VISA-A questionnaire
  - [http://bjsm.bmj.com/content/suppl/2001/11/09/35.5.335.DC1/01055_Fig_1_data_supplement.pdf](http://bjsm.bmj.com/content/suppl/2001/11/09/35.5.335.DC1/01055_Fig_1_data_supplement.pdf) (click on ‘view questionnaire’)

**B. Patient specific functional outcome measure such as:**
- How much weight can be applied to the plantar flexed foot on a weighing scale before the onset of pain
- The number of heel raises before the onset of pain
- The number of heel drops before the onset of pain
- The number of heel drops with a specific weight in a backpack before the onset of pain
- How far can the client walk or run before the onset of pain

**Explanation of Clinical Implications**

- **Strongly consider:** High level/high quality evidence that this should be included in treatment.
- **Consider:** Consistent lower level/lower quality or inconsistent evidence that this should be included in treatment.
- **May consider:** No clinical evidence but expert opinion and/or plausible physiological rationale that this should be included in treatment.
- **Consider NOT:** High level/high quality evidence that this should not be included in treatment.
